The siliceous polymer had a loss on calcination at 700°C of 15-30 (18-28) wt. %.</p> $R_nSi(OM)_p(OH)_{4-n-p} \quad (I)$ $R_nSi(OR')_{4-n} \quad (II)$ <p>M = NH₄ or an alkali metal (pref.); R = 1-20C (1-18C) hydrocarbon gp., opt. halogenated and opt. contg. O or N as heteroatoms; n + p = not above 4; n = 1-3; p = at least 1; and R' = 1-60 alkyl, pref. Me or Et.</p>
<p>An alkaline agent for protecting glass and crockery comprises a siliceous polymer based on an organo-mineral silicate obtd. by condensation polymerisation of (A) an NH₄ or alkali metal silicate with molar ratio SiO₂/M₂O of 0.5-4 (1.2-3.5), and (B) an organo-Si cpd. consisting of (a) an alkali silicate of formula (I), (b) a condensate of siliconates of formula (I), sol. in (A), in aq.</p>	<p> WO 9620268-A+</p>

<p><u>USE</u> Glassware is washed in a dishwasher, using a detergent compsn. contg. 5-40 (10-40) wt. % of the alkaline agent. Deterioration of glass and crockery during repeated washing is reduced.</p> <p><u>PREFERRED AGENT</u> (A) is Na silicate. (B) are (a) 10 siliconates, including methyl-, hexyl- dimethyl-, methylpropyl- and methyloctyl-siliconates of Na or K, and their condensates, (b) methyltri(m)ethoxy-, octyltri(m)ethoxy- and diethylene diamine triethoxysilane, and (c) dimethyldi(m)ethoxy-, and trimethyl(m)ethoxy-silane.</p> <p><u>PREFERRED COMPOSITION</u> A detergent compsn., protecting glass and crockery, contains th siliceous polymer, pref. in amt. of 5-40% (10-40%), and also a builder, a bleach, an anti-incrustation agent and a filler.</p> <p><u>EXAMPLE</u> Microscope slides were immersed for 3 weeks at 60°C in an aq. soln. contg. 5 g/l of aq. Na disilicate (SiO₂:Na₂O = 2.1), contg. 55</p>	<p>wt. % of water. On mixing 99 pts. wt. (dry wt.) of 44.7% of Na silicate (SiO₂:Na₂O = 2) and 1 pt. wt. of a 45.1 soln. of Rhodorsil 51T (RTM: K methylsilicate), the copolymerisation was spontaneous. The copolymer was sepd. giving a prod. with 24.5% loss at 700°C. Microscope slides were immersed in an aq. soln. contg. 5 g/l of the copolymer. Results were pH of soln., initial (A) 11.6, (B) 11.4; final, (A) 11.3, (B) 11.1; wt. change of glass, (A) -2.1mg, (B) 0 mg; appearance, (A) opaque film; (B) no visible corrosion.
